INSTRUCTIONS FOR USE OF SKETCH MAP GRID

1. This plotting grid has been devised to fill a need for a systematic method of producing accurate *memory sketches*. By the use of a "grid-compas" system such as this, greater accuracy of scale can be achieved, and a frame of reference will be available for presenting interview information in graphic form.
2. The chart is divided into inch grids, which in turn are subdivided into half spaces. The scale would normally be 1 inch equals whatever distance the compiler would prefer when beginning the sketch. A standard ratio such as $1'' = 100$ meters, $1'' = 1$ mile, etc., would be preferred, although any unit of measure, in either the English or metric system, is applicable.
3. The reference point for originating a memory sketch using this plotting grid may be at the intersection of the compass lines at the center, or at any other point clearly marked by the compiler. This would be any fixed location with which he is familiar (e.g., a prominent industrial installation, railway station, compiler's home, etc.). If the only precise landmark location is the center of the grid, then the reference point should be made of the distance and direction in which it lies. Should the compiler be familiar with several sections of a given town or area but not the complete town or area, he could sketch several charts with a key reference point for each.
4. The memory sketch may be drawn directly on the printed grid, or it may be drawn on a semi-transparent grid, using the grid merely for determining distance and direction.
